

For many years, the University of the Pacific School of Dentistry has been working to understand the causes of cleft lip and palate anomalies and to develop a protocol for their prevention.

Supported by the March of Dimes, our Program for Prevention of Cleft Lip and Palate/Craniofacial Anomalies developed a brochure and other educational materials to explain the causes of cleft lip and palate and to summarize the prevention studies.

We would like to send you this informative package. If you are interested in receiving the cleft lip and palate material, and also in helping us continue our research toward cleft prevention, please fill out the questionnaire below.

The questionnaire is directed towards the biological mothers of children with cleft anomalies. Please mail, email, or fax the questionnaire to us, and we will send you the educational package.

All the information that you provide will be handled as strictly confidential.

Thank you for your needed support in helping us develop successful methods for the prevention of cleft lip and palate anomalies.
